

Etching PCB DIY

Before sending some PCB to get pro made (really the best time proof solution) it is useful to debug it by etching it yourself

Toner Transfer

A Simple and costless method Flow to make proto PCB based upon **Laser Printed Negative** and **Laminator/Ironer**.

The laminator need a hack to increase heating temperature , but it's a more precise way ta make the transfer than ironer.

Simple side Transfer + Etching

Double side Transfer + Etching

Laminator Transfer

- 1: You need to remove protection fuse here
- 2: Unscrew
- 3: Remove
- 4: You need to add a 190°C klixon
- 4: Add it in parrallel. Rescrew. Done !

Direct Laser Transfer

Isolation Milling

A method that uses **CNC** to engrave around paths to isolate them from rest of PCB board
